Outline

- Assumptions
- What we study and why
- How we use computation tools to do it

Assumptions

- Russian quantitative verse studies are worth doing
 - Andrej Bělj, 1910, *Simvolizm*; Jurij Tynjanov, 1924, *Problema stixotvornogo jazyka*; Viktor Žirmunskij 1925, *Vvedenie v metriku. Teorija stixa*; Kiril Taranovskij, 1953, *Ruski dvodešni ritmovi*; Boris Efenbaum, 1969, *O poezii*; Mixail Gasparov, 1984, *Očerki istorii russkogo stixa. Metrika, ritmika, rifma, strofika*
 - Vladimir Nabokov, 1964, *Notes on prosody*; J. Thomas Shaw, 1993, *Pushkin's poetics of the unexpected: The nonrhymed lines in the rhymed poetry and the rhymed lines in the nonrhymed poetry*; Ian K. Lilly, 1995, *The dynamics of Russian verse*
 - Handbooks and textbooks: Boris Unbegaun 1956, Barry Scherr 1986, Michael Wachtel 2004
 - Generative poetics: Morris Halle, Bruce Hayes, Paul Kiparsky
 - Names to watch: James Bailey, Nila Friedberg, Emily Klenin, Barry Scherr, J. Thomas Shaw, Marina Tarlinskaja
- Target corpus is generally regular syllabotonic verse: stanzas, lines, feet, meter, rhyme

Lexical stress vs metrical ictus

No longer mourn **for me** **when I** am dead
Than you shall hear the surly sullen bell
Give warning **to** the world **that I** am fled
From this **vile world** with vilest worms to dwell:
[Shakespeare, Sonnet 71, iambic pentameter]

○	x		○	x		○	○		○	○		○	x
○	x		○	x		○	x		○	x		○	x
○	x		○	○		○	x		○	○		○	x
○	x		x	x		○	x		○	x		○	x

Lexical stress vs metrical ictus

- Pyrrhic (o o), spondee (x x), trochaic (x o) substitutions in iambic (o x) verse
- Metrical variation
 - Preserves meter, while preventing poetry from becoming “sing-song”
 - Establishes associations among words and lines
 - Modulates the tempo
 - Draws attention to important moments
 - Adapts international meter to local linguistic properties (stress system, word length)

Meter and language: orthography

- In English
 - The relationship between vowel letters and vowel sounds (syllables) is not one to one
- In Russian
 - Every vowel is syllabic
 - No silent vowels (cf. English *Adelaide*)
 - No representation of single vowel sounds by sequences of vowel letters (cf. Eng. *Adelaide*)
- Which means
 - Vowel *letters* in Russian are surrogates for *syllables*

Meter and language: stress

- English
 - Long words often have secondary stress
- Russian
 - Secondary stress only in compound words:
 - трѐхэтажн^ый trëxëtažnyj ‘three-story’
 - Otherwise Russian words, no matter how long, have only primary stress:
 - достопримечательность dostoprimečatel’nost’
 - ‘(tourist) attraction’

Implicit meter and actual stress

НАЦИОНАЛЬНЫЙ ЦЕНТР

И. А. С. Пушкин. Евгений Онегин / Глава первая (1823-1824) [оминимия не счита] [Всё примеры \(1\)](#)

«Мой дядя самых честных правил,
Когда не в шутку занёбд,
Он уважать себя заставил
И лучше выдумать не мбд.»

[И. А. С. Пушкин. Евгений Онегин / Глава первая (1823-1824)] [оминимия не счита] 1/1/1/1/1

Meter and language: word length

- Average word length in Shakespeare Sonnet 71 is 3.8 letters
 - Lots of short words
- Average word length in first stanza of Pushkin's *Eugene Onegin* in Russian is 9.5 letters
 - Lots of long words
- Neither English nor Russian fits binary meter naturally

Meter and language: verse convention

- Russian
 - Strong sense of line
 - Strong sense of foot
 - Strong syllabotonic orientation
- English
 - Stronger role for tonic organization

“The old woman of Berkeley”

Robert Southey (1774–1842; 1799)

The ra|ven croaked | as she sate | at her meal, | 2 2 3 3 a
And the Old | Woman knew | what he said; | 3 3 3 b
And she | grew pale | at the Ra|ven’s tale, | 2 2 3 2 c
And sick|ened, and went | to her bed. | 2 3 3 b

Vasilij Andreevič Žukovskij (1783–1852; 1814/1831)

На кро|вле во|рон ди|ко про|кричал —| 2 2 2 2 a
Стару|шка слы|шит и | бледнеет. 2 2 2+ B
Понят|но ей, | что во|рон тот | сказал: | 2 2 2 2 a
Слегла | в постель, | дрожит, | хладеет. 2 2 2+ B

What quantitative metrics tells us about Russian verse

- Final stress must always be realized
- “Law of regressive accentual dissimilat (Taranovski)
 - Pre-final foot is weakest
 - iambic tetrameter: 2 3 1 4
 - iambic pentameter: 3 2 4 1 5
- Pattern holds over 18th, 19th, 20th centuries (Friedberg), but with changes
- No such regularity in English (Tarlinskaja)

Methodology

- Knowledge-based
- Output
 - Goals: meter, rhyme (and more?)
 - Sample output
- Assumptions about the input
- Linguistic prerequisites
 - Stress
 - Pronunciation
- Determining meter
- Determining rhyme

What the system should tell us

- For individual poems:
 - Identify which syllables are stressed linguistically
 - Identify metrical structures and ambient meter
 - Identify deviations from the ambient meter
 - Identify rhyme schemes
 - (Other formal regularities?)
- Corpus level
 - Historical patterns (authors, periods, movements)
 - Relationships between form and meaning
 - E.g., semantic halo

Sample browsing output

<oo> → <met> Meter, rhythm, and rhyme

Его речь (Борис Леонидович Пастернак)

Line	Text	Meter	Rhyme	Stressed Vowels
1	Я полюбо говорю его	ox oo ox ox	a	o o o
2	Прошла мне искрами загвоздок	ox ox oo ox(o)	B	I I I
3	Как широк мелкие шаровой	ox ox oo ox	c	o o o
4	Все встала с мест глазми лугине	ox ox ox ox(o)	D	A A A U
5	Облачивая крайний стол	ox oo ox ox	e	A A O
6	Как ядру он вырос на трибуне	ox ox oo ox(o)	D	U I U
7	И вырос рыцарь чем вошёл	ox ox ox ox	e	I A B O
8	Он проскользнул неуслышано	oo ox oo ox(o)	F	U I
9	Сквозь строй преступный и подног	ox ox oo ox	g	o A o
10	Как улет в ожидану без дана	ox ox oo ox(o)	F	B O I
11	Грози алчущий комки	ox ox oo ox	g	I A O
12	Он был как волгод на рашире	ox ox oo ox(o)	H	I I I
13	Гонимся за высказанным исход	ox ox oo ox	I	A I B

From plain text input to rich output

- Input must be in native Russian orthography
 - Native Russian orthography almost never marks stress
- Meter
 - Meter depends on stress
- Rhyme
 - Rhyme depends on pronunciation
 - Pronunciation can be inferred from orthography only if stress is also known
- But if we can determine stress automatically ...

Procedure

1. Dictionary lookup
2. Metrical valence
3. Strong and weak position
4. Metrical type (binary ~ ternary)
5. Metrical subtype (foot type)
6. Line length
7. Catalexis and hypermetricality
8. (Rhyme)

1. Dictionary lookup

- Input is word in normal orthography
 - Mixed case, punctuation, no stress
 - Dictionary contains word forms with stress and morphological information
 - Morphological information is irrelevant for our purposes
- Output has all vowels tagged
 - Stressed
 - Unstressed
 - Unknown
 - Not in dictionary
 - Dictionary evidence is contradictory

2. Metrical valence

- For each vocalic position in the line
- Metrical valence
 - Stressed / (stressed + unstressed)
 - Ignore unknowns
- Varies between 0 and 1

3. Strong and weak position

- Compare valence of each position to preceding and following
 - Assume a 0 value if preceding or following is missing, i.e., at beginning or end of a line
- If target value is higher than both neighbors: strong
- If target value is lower than both neighbors: weak
- Otherwise: weak
 - Provisional; adjacent strong positions do not occur in common Russian meter

4. Metrical type (binary ~ ternary)

- Calculate how often the strong ~ weak property of a syllable matches the property two (resp. three) syllables earlier
- Count both strong/strong and weak/weak matches
- The greater number of matches determines the type
- Resolve ambiguities according to positional valence (where possible)

5. Metrical subtype (foot type)

- Having determined metrical type (binary ~ ternary)
- Subtype is based on last foot
 - Last stress is the only obligatory one
 - Iamb ~ trochee
 - Dactyl ~ anapest ~ amphibrach

6. Line length (number of feet)

- Number of strong positions = number of feet
- May be global or line-specific

Во всем мне хочется дойти	оx ox ox ox
До самой сути.	ox ox (o)
В работе, в поисках пути,	ox ox oo ox
В сердечной смуте.	ox ox (o)

[Pasternak 1956]

7 Catalexis and hypermetricality

- Catalexis: Number of syllables
 - Is sufficient for the number of feet
 - Is not sufficient for the number of complete feet
- Hypermetricality
 - Syllables after the final stress are easily identified
 - Hypermetrical caesura: Demarcate feet based on strong position

Как ветер мокрый, ты бьешься в ставни,	ox ox (o) ox ox (o)
Как ветер черный, поешь: ты мой!	ox ox (o) ox ox
Я древний хаос, я друг твой давний,	ox ox (o) ox ox (o)
Твой друг единый, открой, открой!	ox ox (o) ox ox

[Gippius, Nelliubov', 1907]

Taking stock

- We can count syllables by counting vowel letters
- If we know the place of stress
 - We get meter
 - We get most pronunciation ...
... and therefore most rhyme
- If we also know $e \sim \ddot{e}$
 - We get the rest of pronunciation
 - We also get rhyme

Thank you!
